SMARTER INTELLIGENCE. FASTER ANSWERS.

TURN A SINGLE IDENTIFIER INTO A FULL INVESTIGATIVE PICTURE — IN SECONDS

Intellego XT integrates investigative data sources, including dark web activity, compromised credentials, location intelligence, and social media, to rapidly uncover digital context, historical location, and hidden associations. It enables investigators to move from intercepted identifiers to actionable intelligence in seconds, without swivel-chair workflows.

OVER 600 DATA SOURCES INCLUDING:

- Dark web and compromised credential datasets
- Mobile advertising & location intelligence (AdTech / MAID)
- Social media platforms, forums, and messaging ecosystems
- Public and restricted PII databases
- Online marketplaces, breach repositories, and underground services

WHAT AN INVESTIGATOR CAN DO

- Pivot instantly. Start from a phone number, email, username, IP, wallet or device ID and expand automatically to every linked footprint across the open and dark web.
- Expose hidden identities. Surface aliases, burner accounts, reused passwords and shared infrastructure that connect one subject to another.
- Reconstruct movement. Use mobile advertising ID (MAID) and location intelligence to build pattern-of-life, co-location and timeline analysis — historically, not just from today forward.
- Automate the write-up. Generate executive summaries, risk assessments and key findings with confidence levels and source reliability scoring attached.
- Fuse with lawful intercept. Enrich Intellego iDossiers automatically so OSINT, AdTech and intercepted communications sit side by side in a single case file.

SEE IT IN ACTION

Search Across Data: Access and search across social media, forums, news, dark web activity, compromised credentials, and public records — uncovering reused passwords and shared IP addresses that link the suspect to multiple accounts and, ultimately, a second identity tied to the breach.

Automate Reporting: Intellego XT's data engine automatically synthesizes large volumes of open-source intelligence into clear, actionable summaries — analyzing identities, credentials, devices, IP addresses, and digital activity to generate executive summaries, risk assessments, and key findings, complete with confidence levels and evidentiary reliability.

Location-Based Investigation: Geofence and cross-reference device activity between locations and timeframes. Investigators can drill into timelines, create movement heatmaps, and obtain device details (make, model, OS, browser, IP addresses).

From a single lead to a complete investigative picture — faster, more connected, and without manual legwork.
